Algorithmic complexity of finding cross-cycles in flag complexes

Michał Adamaszek, Juraj Stacho

University of Warwick, UK Centre for Discrete Mathematics and its Applications (DIMAP)

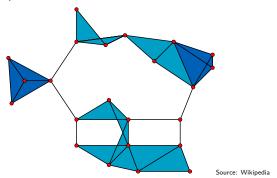

Introduction

Combinatorial algebraic topology:

- Given an interesting class of combinatorial objects (graphs, posets, lattices, hyperspace arrangements...)
- ... and a construction which assigns to them topological spaces ...
- ... what are the relations between the combinatorial and topological properties?
- Algorithms?

Clique complexes

• If G is a graph, then the clique complex Cl(G) is the simplicial complex whose faces are the cliques (complete subgraphs) of G.

- Geometric example: Vietoris-Rips complexes.
- a.k.a. flag complexes

Independence complexes

•

• If G is a graph, then the independence complex $\operatorname{Ind}(G)$ is the simplicial complex whose faces are the independent sets (edge-free sets) of G.

$$\operatorname{Ind}(G) = \operatorname{Cl}(\overline{G}).$$

Independence complexes

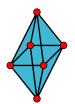

•

• If G is a graph, then the independence complex $\operatorname{Ind}(G)$ is the simplicial complex whose faces are the independent sets (edge-free sets) of G.

$$\operatorname{Ind}(G) = \operatorname{Cl}(\overline{G}).$$

 Example: cross-polytope boundaries Ind(e) Ind($e \sqcup e$) Ind($e \sqcup e \sqcup e$)

$$S^0$$

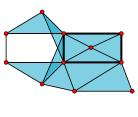

$$S^1 = S^0 * S^0$$

$$S^1 = S^0 * S^0$$
 $S^2 = S^0 * S^0 * S^0$

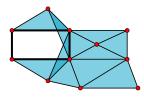

Spherical homology classes

- The homology group $H_k(L)$ "counts k-dim holes" in L.
- The "smallest holes" in flag complexes are given by embedded cross-polytopal spheres:

$$S^{k-1} = \underbrace{S^0 * \cdots * S^0}_{k} \hookrightarrow L$$
 gives an element of $H_{k-1}(L)$.

trivial

non-trivial

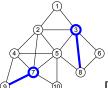

Cross-cycles and matchings

Definition (Cross-cycle, topologically)

A cross-cycle in a flag complex L is a homology class defined by an embedded subcomplex $S^0 * \cdots * S^0$, such that at least one face of that subcomplex is a maximal face of L. Such a homology class is non-zero.

Definition (Cross-cycle, combinatorially)

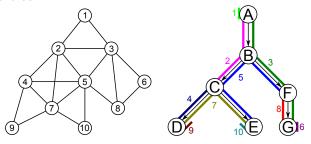

A cross-cycle in $\operatorname{Ind}(G)$ corresponds to an induced matching in G which contains a maximal independent set of G.

Defines an element of $H_1(\operatorname{Ind}(G))$.

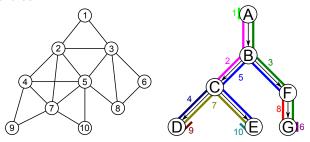

Chordal graphs

• A graph is chordal iff it is an intersection graph of subtrees of a fixed tree.

Chordal graphs

 A graph is chordal iff it is an intersection graph of subtrees of a fixed tree.

- Extensively studied in algorithmic graph theory.
- Well studied $\operatorname{Ind}(G)$: topologically (Woodroofe, Kawamura, Engström, ...), algebraically (van Tuyl, Engström, Dao).

Topology vs. combinatorics

Theorem (Homology of chordal graphs is combinatorializable)

If G is a chordal graph then the homology group $\mathrm{H}_*(\mathrm{Ind}(G))$ has a basis consisting of cross-cycles.

Consequently,

• $H_{k-1}(\operatorname{Ind}(G))$ is non-trivial

if and only if

 G has an induced matching of size k containing a maximal independent set.

Main results

Theorem (Poly-time)

The following problem is solvable in polynomial time.

• Given a chordal graph G, decide if Ind(G) has trivial homology in all dimensions:

$$\widetilde{H}_i(\operatorname{Ind}(G)) = 0 \text{ for all } i ?$$

Theorem (Hardness)

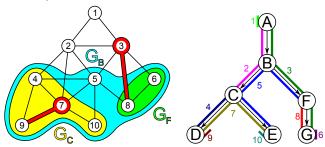

The following problem is NP-complete.

• Given a chordal graph G and an integer k, decide if

$$H_k(\operatorname{Ind}(G)) = 0$$
?

The algorithm for chordal graphs

• A bottom-up recursion in the tree model of G.

- Computes special solutions that can be easily merged over subtrees.
- But no control over size.

Hardness consequences

Theorem (Homology is hard for flag complexes)

The following problem is NP-hard:

• Given a graph G and an integer k, decide if

$$H_k(Cl(G)) = 0$$
 ?

Theorem (Homology is hard for arbitrary simplicial complexes)

The following problem is NP-hard:

 Given a simplicial complex L, presented as the list of maximal faces (facets), and an integer k, decide if

$$H_k(L) = 0$$
 ?

Questions

• Connectivity $\geq k$?

$$H_i(L) = 0$$
 for $i \le k$.

• Homological dimension $\leq k$?

$$H_i(L) = 0$$
 for $i > k$.

Questions

• Connectivity $\geq k$?

$$H_i(L) = 0$$
 for $i \le k$.

• Homological dimension $\leq k$?

$$H_i(L) = 0$$
 for $i > k$.

Thank you!
